DIRECTORATE OF INTELLIGENCE
12 JULY 1983Brazil: The Soybean Market [redacted]

25X1

[redacted] Brazil now ranks second to the United States in the production and export of soy products. [redacted]

25X1

25X1

According to US Department of Agriculture statistics, Brazil will harvest about 15 million metric tons of soybeans during the current crop year (table attached). The crop is allocated as follows:

- About 10.3 million tons is processed into meal, 80 percent for export. The trade publication, Oil World, indicates that Brazilian soymeal is mainly exported to the EEC and Soviet Bloc countries.
- Brazilians will consume about 2.1 million tons of meal internally, primarily as feedstock for the livestock and poultry sectors.
- Another 2.5 million tons is processed into oil, about 60 percent for use by Brazilian low-income consumers. The remainder is exported, mainly to Mid-Eastern markets.
- About 1.2 million tons of beans is consumed in Brazil and about 1.0 million tons is exported worldwide.
- Brazil will hold about 4.5 million tons of beans in stock at the end of the harvest and another 1.1 million tons in meal and oil. [redacted]

25X1

This memorandum was requested by the Deputy Secretary of Treasury. It was prepared by [redacted] South America Division, Office of African and Latin American Analysis. Questions and comments may be directed to Chief, South America Division, ALA, [redacted]

CONFIDENTIAL

Unlike Washington, Brasilia intervenes heavily in the market. Prices are controlled, especially for soybean products, at the retail level. To assure an adequate domestic crop, however, farmers are treated to production incentives. The government guarantees producers a support price for soybeans. Farmers have the option of selling at market or to a Brazilian government agency. Soy producers are also treated to subsidized credit for production and marketing expenses. [REDACTED]

25X1

25X1

Export marketing is also government controlled. Export taxes and quotas are used to assure adequate domestic soy supplies. Overseas marketing is handled by government and private firms. We believe Brazilian government trading companies are primarily responsible for handling sales to Soviet countries, especially those to the USSR guaranteed under long-term trading agreements. The private sector--Brazilian cooperatives and US multinational trading companies--apparently play the major role in shipping soy products to free-world destinations. These sales are negotiated annually on a contractual basis. [REDACTED]

25X1

Brazilian soy exports are mainly shipped in the second half of the calendar year. The crop is planted in November and December, and the growing season lasts through March. Harvesting commences in April and is generally completed by the end of May. Export sales begin in June with the bulk sold in the September-November period. [REDACTED]
